World record holder in water bottling takes part in Gulfood Manufacturing

Around 800 years ago, the polymath Ismail Al-Jazari invented five machines for lifting water, as well as water mills and water wheels with cams, plus various pumps and valves - and thus helped shape the technological progress of mankind. Centuries later, this progress can be impressively discovered at this year's Gulfood Manufacturing in Dubai on the Krones stands C1-4 and D1-4 in hall 1.

Nowadays we're talking about more than simply lifting small masses of water. With the world's first wet-end block invented by Krones handling an output of 100,000 containers an hour, the dimensions have evolved. At Gulfood Manufacturing, you can learn more about this record-breaking Ergobloc L and furthermore get advice from our water sommeliers on the subject of water design.

But there is more to discover: you can also receive solutions that help you reduce your resource and energy consumption, close your material circuits and produce sustainable beverages. To achieve this, we use the options of digitalization as well as our strength in a broad portfolio – from systems for process technology, filling and packaging lines to intralogistics and recycling.

The Krones team looks forward to welcoming you at this year's Gulfood Manufacturing!
